PERIODICAL: Voyenno-meditsinskiy zhurnal, 1958, Nr 5, pp 60 - 62
(USSR)

ABSTRACT: The authors give the results of a 3-year parasitological reconnaissance for specifying the representatives of the Ixodidae family in military camps in various geographical zones such as woodlands, the forest-steppe and the steppe. Among the ticks in the woodlands, they identified predominantly Dermacentor marginatus, Ixodes ricinus and Dermacentor pictus; in the forest-steppe prevailed Ixodes ricinus, Rhipicephalus and Laelaps algericus, and in the steppe Hyalomma scupense, Dermacentor marginatus and Rhipicephalus. The authors stress the importance of sy-

TITLE: Actinomyces aureofaciens strain LSB-181, producing chlortetra-cycline and tetracycline. Class 30, No. 187242. [Announced by All-Union Scientific Research Institute for Antibiotics (Vsesoyuznyy nauchno-issledovatel'skiy institut antibiotikov)]

SOURCE: Izobrateniya, promyshlennyye obraztsy, tovarnyye znaki, no. 20, 1966, 104

TOPIC TAGS: antibiotic, drug, Actinomyces aureofaciens, chlortetra-cycline, tetracycline

ABSTRACT: An Author Certificate has been issued for strain LSB-181 of Actinomyces aureofaciens. Light-sensitive mycelia in 5-6 mm colonies appear on its tenth day of growth on no. 12 organic agar medium at 28C. On no. 11 synthetic medium, dirty-white colonies 2.5-3 mm in diameter appear, and on pea medium, brown, raised, wrinkled, as porulating colonies seven mm in diameter are found. Milk is completely peptonized on the tenth day, and coagulation is noted on the 15th day, at which

time the gelatin is also slightly liquified. The sporophores lack coils, and spores are rectangular and oval. Activity in laboratory conditions on regulation media with corn extract is of the order of 5000—5600 j/ml. Also, this strain is resistant to actinophages 22 and 22a. [WA-50]

TITLE: Causes of nonuniform wear of tractor-engine journals and bushings

SOURCE: Ref. zh. Dvigatelyi vnutrennego sgoraniya, Abs. 3.39.34

REF SOURCE: Sb. nauchn. tr. aspirantov. Belorussk. in-t mekhaniz. s. kh.
Minsk, 1965, 296-308

TOPIC TAGS: tractor engine journal, bushing, journal bushing, connecting rod bearing, internal combustion engine, piston engine, nonuniform wear, journal wear

ABSTRACT: The primary factor determining the pattern of the nonuniform wear along the circumference of journal bushings of connecting-rod bearings is the failure of the carrying capacity of the layer of lubricant in these bearings at instants when the crank passes the regions of the lower dead points, and of the upper dead point at the end of the exhaust stroke. The application of inertia forces of considerable magnitude and duration to the bearing during these periods of the cycle only increases the nonuniform wear and therefore is a secondary cause. The

ACC NR: AR6023333

failure of the carrying capacity of the lubricant layer in connecting-rod bearings in the regions of the lower dead points of the cycle and the upper dead point at the end of the exhaust stroke depends on the characteristic design features of the slider crank mechanism itself. In this connection, it is expedient to investigate the effect of the parameters of this mechanism on the magnitude of the reduced angular velocity in a connecting-rod bearing and, consequently, also on the wear of journals and bushings of connecting-rod bearings of internal-combustion piston engines.

Food

Gelation of pectin. I. Irreversible change in pectin during gelation. B. Ogulyanov, G. Kursakoly, and M. Marinov, *Annuaire fac. sci.-phys. et math. (Sofia)*, *Chemic* 47, 60-90 (1952) (German summary).—Gel (0.5 g.) from apple pectin (I) was dissolved in 20 ml. warm H₂O, the soln. boiled to initial wt., the surface covered with liquid paraffin and left to gel; 24 hrs. later the gel strength and the relative viscosity of its aq. soln. were detd. This process was repeated several times. The results show that strength and viscosity decrease with repetition of gelation. Besides hydrolysis of I, homopolar bonding through lactone and ester ionization could be responsible for the thermally irreversible change. II. Effect of degree of esterification upon gelation. *Ibid.* 91-103.—Above 50% esterification (II) the gel strength (III) reaches a max. at 64%, the gelation rate (IV) decreases between 62 and 61% and increases above that, and the optimum acidity increases with II. Below 50% II; III and IV depend upon Ca content; below 35% II pectin cannot be esterified in the absence of Ca.

TITLE: The mechanism of intensification of acoustic oscillations by
the burning surface of a solid fuel

SOURCE: Zhurnal prikladnoy mehaniki i tekhnicheskoy fiziki, no. 4,
1964, 135-136

TOPIC TAGS: combustion, solid propellant, explosive, propellant,
combustion instability

ABSTRACT: The conditions under which acoustic oscillations in the
combustion of solid propellants are intensified by the burning surface
were analyzed by use of the model shown in Fig. 1 of the Enclosure.
A layer is considered which is bounded by the surfaces designated as
(-) and (+). The distance between the surfaces is constant. The
surface (-) is situated in the gas phase at a point where the reaction
is completed. The heat flux through this surface is given by a small
value. The change in parameters to the left of this surface is con-
sidered to be isentropic. To the right of the surface (+), the gas is

Card 1/4

L 10692-65

ACCESSION NR: AP4044734

ideal and has a fixed chemical composition. Curve 1 shows the density distribution in the layer at steady-state combustion. Curve 2 represents the adiabatic density distribution in the presence of a rapid pressure increase caused by passage of the acoustic wave front. Curve 3 represents the steady-state density distribution at a certain frequency acoustic oscillations:

$$\frac{p}{m\tau} \left\{ \left(\frac{\partial M}{\partial p} \right)_{\infty} - \left(\frac{\partial M}{\partial p} \right)_0 \right\} + \frac{k-1}{k} - \left(1 - \frac{p_+}{p_- p_- c_-} \right) > 0,$$

where p is the pressure, m is the mass flux, τ is the characteristic time for redistribution of the parameters in the considered layer during relaxation, M is the mass in the considered layer, p_- and p_+ are density fluxes in the surfaces (-) and (+), respectively, k is the adiabatic exponent of combustion products, and c_- is the adiabatic velocity in the surface (-). The subscript ∞ refers to the steady state, where ω is the frequency. Orig. art. has: 10 formulas in 1 figure.

REF SOURCE: Tr. molodykh uchenykh. (Materialy Mezhvuz. konferentsii). Saratovsk. politekhn. in-t. Vyp. tekhn. Saratov, 1965. 40-46

TOPIC TAGS: internal combustion engine, gasoline engine, liquid fuel, motor vehicle gasoline

ABSTRACT: Gas condensates from many deposits are close to automotive gasoline in physical and chemical properties. Gas condensates from the Bagayev, Goryuchkinsk, Peschano-Umetsk, Uritsk and Aleksandrovsk deposits are full-value substitutes for gasoline and may be used as fuel in carburetor engines in pure form without preliminary processing but after stabilization. Engines operating on these gas condensates do not require additional carburetor regulation, with power and economic indices remaining practically identical to those for gasoline.. Engine wear with operation on gas condensates is an average of 15% lower than on gasoline. [Translation of abstract]

Physicochemical Bases of (Cont.)

PURPOSE: This collection of articles is intended for engineers and technicians of metallurgical and machine-building plants, senior students of schools of higher education, staff members of design bureaus and planning institutes, and scientific research workers.

COVERAGE: The collection contains reports presented at the fifth annual convention devoted to the review of the physicochemical bases of the steelmaking process. These reports deal with problems of the mechanism and kinetics of reactions taking place in the molten metal in steelmaking furnaces. The following are also discussed: problèmes involved in the production of alloyed steel, the structure of the ingot, the mechanism of solidification, and the converter steelmaking process. The articles contain conclusions drawn from the results of experimental studies, and are accompanied by references of which most are Soviet.

TITLE:

Synthesis of vinyl xylenes on the basis of xylenes and
ethylene

PERIODICAL:

Referativnyy zhurnal. Khimiya, no. 11, 1961, 190, abstract
11491 (Uch. zap. Yaroslavsk. tekhnolog. in-ta, 1960, 5,
79-89)

TEXT: In the alkylation of m-xylene (I) by means of ethylene (molar ratio 2 : 1), the minimum yield (~1% by weight of the resulting alkylate) in products of disproportionation (PD) with the boiling point 145-180°C [$\text{CH}_3\text{C}_6\text{H}_4\text{C}_2\text{H}_5$, $(\text{CH}_3)_3\text{C}_6\text{H}_3$] was obtained at 80-85°C and with 2% AlCl_3 , while the yield in ethyl xylene (II) was ~30%, or 95-97% of the reacted (I). The polyproducts are smoothly dealkylated to (II) under the conditions of the main reaction. The effect of temperature and AlCl_3 concentration on the PD yield was studied. Vinyl xylene (yield 20-25%)

TITLE: Synthesis of di-tert-butylbenzoic acid

SOURCE: Yaroslavl'. Tekhnologicheskiy institut. Khimiya i khimicheskaya tekhnologiya, vol. 1 (8), 1962, 91-99

TOPIC TAGS: benzoic acid, isobutylene, toluene, polymerization, emulsifier, surface active substance, alkali metal

ABSTRACT: Di-tert-butylbenzoic acid is a product which previously has not been produced and has not been used on industrial scales. Only short references have been made to the possibility of its synthesis. The authors suggest that the manufacture of di-tert-butylbenzoic acid is feasible from inexpensive raw material; toluene and isobutylene. This was done in three stages. It was shown that a convenient method of obtaining di-tert-butyltoluene is the disproportioning of tert-butyltoluene in the presence of aluminum chloride in the continuous extraction of toluene (in order to shift the equilibrium of the reaction). Such a method assures a yield of the object product on the order of 90% for the converted tert-butyltoluene from the theoretic. By means of the liquid phase of oxidation di-tert-butyltoluene

Card 1/2

ACCESSION NR: AT4029923

in the presence of a catalyst it was possible to obtain a high-yield of di-tert-butylbenzoic acid. Di-tert-butyltoluene and di-tert-benzoic acid were separated and characterized. The salts of alkali metals of di-tert-benzoic acid were good emulsifiers in the processes of emulsion polymerization. Orig. art. has: 2 figures and 5 tables.

In this pamphlet a very brief and semi-popular account is given of the chief species of insects and fungi which destroy felled timber and constructional woodwork in Russia, and of the means for their control. Most of the information regarding fungi deals with those that occur in buildings, such as *Merulius lacrymans*, *Poria vaporaria*, *Coniophora cerebula*, *Pomacруса*, and *Puccinellia ochracea* [*P. panuoides*], the development of which is stated to have attained threatening dimensions in many parts of the country [R.A.M., ix, p. 334].
